

POWER QUERY DATA CLEANING & TRANSFORMATION

Entertainment Domain – Netflix Content Analysis

1. Objective

This document records the data cleaning and transformation activities performed in Microsoft Power Query to convert the raw Netflix dataset into a structured, analysis-ready dataset.

2. Transformation Strategy

- Import the CSV dataset into Power Query.
- Validate column names and data types.
- Apply data quality transformations.
- Standardize text values and categorical fields.
- Remove invalid and duplicate records.
- Prepare the dataset for Power BI data modeling.

3. Transformation Log

Step	Transformation	Business Reason	Status
1	Import CSV	Load source dataset	Completed
2	Rename Queries	Improve readability	Completed
3	Change Data Types	Ensure accurate analysis	Completed
4	Remove Duplicates	Eliminate redundant records	Completed
5	Replace Null Values	Handle missing data	Completed
6	Trim & Clean Text	Remove extra spaces/non-printable characters	Completed
7	Standardize Type Values	Convert Movie/movie/MOVIE to Movie	Completed
8	Standardize Country Names	USA/U.S. → United States	Completed
9	Validate Release Year	Remove invalid future years	Completed
10	Validate IMDb Ratings	Correct/remove invalid scores	Completed
11	Remove Negative	Maintain data	Completed

	Values	integrity	
12	Create Conditional Columns	Support reporting	Completed
13	Close & Apply	Load cleaned data to model	Completed

4. Data Quality Improvements

- Missing values handled.
- Duplicate records removed.
- Data types standardized.
- Categorical values normalized.
- Invalid records corrected or removed.
- Dataset prepared for analytical modeling.

5. Output

The output of this phase is a clean, validated, and analysis-ready dataset that can be loaded into Power BI for data modeling, DAX development, and dashboard creation.
