

DATA MODELING (POWER BI)

Entertainment Domain – Netflix Content Analysis

1. Objective

The objective of the data modeling phase is to organize the cleaned Netflix dataset into an efficient analytical model that supports fast reporting, accurate calculations, and scalable dashboard development in Power BI.

2. Data Modeling Approach

- Import the cleaned dataset into Power BI.
- Review and validate data types.
- Design a star schema where appropriate.
- Create dimension and fact tables.
- Establish relationships between tables.
- Create a Date table for time intelligence.
- Validate model performance and integrity.

3. Proposed Data Model

Table	Type	Purpose
Fact_NetflixContent	Fact	Stores content metrics and measures
Dim_Date	Dimension	Supports time-based analysis
Dim_Country	Dimension	Country analysis
Dim_Genre	Dimension	Genre analysis
Dim_Rating	Dimension	Content rating analysis
Dim_Director	Dimension	Director analysis

4. Relationships

From	To	Cardinality	Cross Filter
Fact_NetflixContent	Dim_Date	Many-to-One	Single
Fact_NetflixContent	Dim_Country	Many-to-One	Single
Fact_NetflixContent	Dim_Genre	Many-to-One	Single
Fact_NetflixContent	Dim_Rating	Many-to-One	Single
Fact_NetflixContent	Dim_Director	Many-to-One	Single

5. Modeling Best Practices

- Use descriptive table and column names.
- Hide technical keys from report view.
- Avoid many-to-many relationships where possible.
- Use a dedicated Date table.
- Maintain single-direction filtering unless business logic requires otherwise.
- Optimize model by removing unused columns.

6. Expected Output

A validated Power BI data model that supports DAX measures, KPI calculations, interactive dashboards, and reliable business reporting.
